Introduction to Computer Science,
Fall semester 2010-2011
IDC Herzliya

Classes, objects, references, encapsulation and whatnot

© Boaz Kantor, IDC

Agenda

- Object state (4 to 6)
- Methods and parameters (7 to 8)
- Visibility and encapsulation (9 to 10)
- Return values (11 to 13)
- Aliases (14 to 15)
- Constructors (16 to 19)
- Static (20 to 28)
- Standard methods (29 to 31)
- String vs. StringBuilder (32)

© Boaz Kantor, IDC

Our mission

- Write a class called “Dog”
- The class will represent a real-life dog
- The dog has a breed, age and name
- Implement constructors, getters & setters

© Boaz Kantor, IDC

Where to begin?

1. Write a skeleton:

```
public class Dog {
    String breed;
    String name;
    int age;
}
```

4

© Boaz Kantor, IDC

2. Write a driver:

```
public class Owner {
    public static void main(String[] args) {
        Dog pooch = new Dog();
    }
}
```

5

© Boaz Kantor, IDC

How it looks in memory

```
public class Dog {
    String breed;
    String name;
    int age;
}

// in the main() method of class Owner:
Dog pooch = new Dog();
pooch.age = 4;
pooch.age = -1;
```

6

© Boaz Kantor, IDC

A method, parameters, what is this?

```
public class Dog {
    String breed;
    String name;
    int age;
    setAge(int age) {
        if (age > 0 && age < 99) {
            this.age = age;
        }
    }
}
```

7

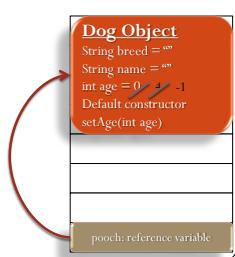

© Boaz Kantor, IDC

```
public class Dog {
    String breed;
    String name;
    int age;
    setAge(int age) {
        if (age > 0 && age < 99) {
            this.age = age;
        }
    }
}

// in the main() method of class Owner:
Dog pooch = new Dog();
pooch.setAge(4);
pooch.setAge(-1);
pooch.age = -1;
```

8

© Boaz Kantor, IDC

Visibility & encapsulation

```
public class Dog {
    private String breed;
    private String name;
    private int age;
    public setAge(int age) {
        if (age > 0 && age < 99) {
            this.age = age;
        }
    }
}
```

9

© Boaz Kantor, IDC

```

public class Dog {
    private String breed;
    private String name;
    private int age;
    public setAge(int age) {
        if (age > 0 && age < 99) {
            this.age = age;
        }
    }
}

// in the main() method of class Owner:
Dog pooch = new Dog();
pooch.setAge(4);
pooch.setAge(-1);
pooch.age = -1;           // COMPILE TIME ERROR!
int poochAge = pooch.age; // COMPILE TIME ERROR!

```

10 © Boaz Kantor, IDC

Dog Object
String breed = "
String name = "
int age = 0
Default constructor
setAge(int age)

pooch: reference variable

Return values

```

public class Dog {
    private String breed;
    private String name;
    private int age;
    public void setAge(int age) {
        if (age > 0 && age < 99) {
            this.age = age;
        }
    }
    public int getAge() {
        return this.age;
    }
}

```

11 © Boaz Kantor, IDC

```

public class Dog {
    private String breed;
    private String name;
    private int age;
    public void setAge(int age) {
        if (age > 0 && age < 99) {
            this.age = age;
        }
    }
    public int getAge() {
        return this.age;
    }
}

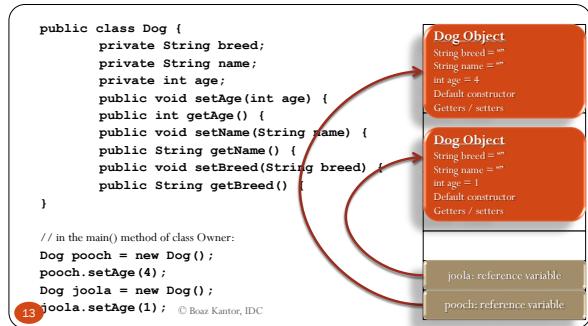

// in the main() method of class Owner:
Dog pooch = new Dog();
pooch.setAge(4);
int poochAge = pooch.getAge();

```

12 © Boaz Kantor, IDC

Dog Object
String breed = "
String name = "
int age = 4
Default constructor
setAge(int age)
int getAge()

pooch: reference variable

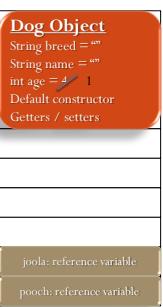

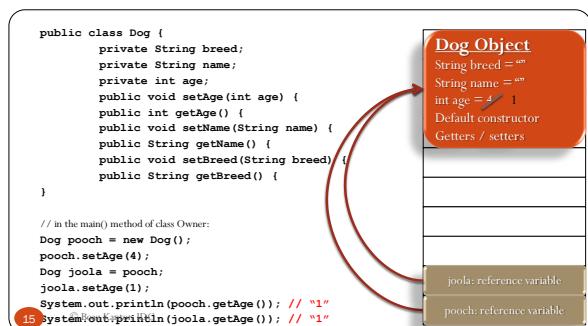

Aliases

- When a reference variable X points to an object, and a reference variable Y points to the same object, we say that Y is an alias of X, that X is an alias of Y and that they are both aliases of each other.
- It's not always that you have to create aliases, and not always avoid them, but you should always be aware when aliasing occurs.
- This is because aliasing may compromise the encapsulation principles.

14

© Boaz Kantor, IDC

Constructors

```
public class Dog {
    private String breed;
    private String name;
    private int age;
    public Dog(int age, String breed, String name) {
        this.setAge(age);
        this.setBreed(breed);
        this.setName(name);
    }
    // getters and setters below
    // setAge(int age), getAge()
    // setName(String name), getName()
    // setBreed(String breed), getBreed()
}
```

16

© Boaz Kantor, IDC

```
public class Dog {
    private String breed;
    private String name;
    private int age;
    public Dog(int age,
              String breed
              String name) {
        this.setAge(age);
        this.setBreed(breed);
        this.setName(name);
    }
    // getters and setters
}

// in the main() method of class Owner:
Dog pooch = new Dog();           // COMPILATION ERROR
Dog pooch = new Dog(4, "Boxer");
Dog joola = new Dog(1, "Mixed", "joola");
System.out.println(pooch.getAge()); // "4"
System.out.println(joola.getAge()); // "1"
```

17

© Boaz Kantor, IDC

More on constructors

```
public class Dog {
    private String breed;
    private String name;
    private int age;
    private static final int DEFAULT_AGE = 0;
    private static final String DEFAULT_BREED = "unknown";
    private static final String DEFAULT_NAME = "n/a";
    public Dog() {
        this.setAge(DEFAULT_AGE);
        this.setBreed(DEFAULT_BREED);
        this.setName(DEFAULT_NAME);
        OR:
        this(DEFAULT_AGE, DEFAULT_BREED, DEFAULT_NAME);
    }
    public Dog(int age, String breed, String name) {
        this.setAge(age);
        this.setBreed(breed);
        this.setName(name);
    }
    // getters and setters below
}
```

18

© Boaz Kantor, IDC

```

public class Dog {
    private String breed;
    private String name;
    private int age;
    public Dog() {
        this(DEFAULT_AGE, ...);
    }
    public Dog(int age,
               String breed,
               String name) {
        this.setAge(age);
        this.setBreed(breed);
        this.setName(name);
    }
    // getters and setters
}

// in the main() method of class Owner:
Dog pooch = new Dog(4, "Boxer", "Pooch");
Dog jocie = new Dog();

```

New exercise

- Our mission:
 - Write a class called Ball
 - Each ball has colors
 - Implement the following API:
 - Constructors, getters, setters, yada yada yada...
 - getShape() to return the shape of the ball

© Boaz Kantor, IDC

We already know all this

```
public class Ball {  
    private String color = "";  
    public Ball(String color) {  
        this.color = color;  
    }  
    public String getShape() {  
        return "Round";  
    }  
}
```

© Boaz Kantor, IDC

```

public class Ball {
    private String color = "";
    public Ball(String color) {
        this.color = color;
    }
    public String getShape() {
        return "Round";
    }
}

// in the main() method of class Owner:
Ball basketball = new Ball("Brown");
Ball tennisBall = new Ball("Green");

String basketBallShape = basketball.getShape();
String tennisBallShape = tennisBall.getShape();
System.out.println(basketBallShape); // "Round"
System.out.println(tennisBallShape); // "Round"

```

Static methods

```
public class Ball {  
    private String color = "";  
    public Ball(String color) {  
        this.color = color;  
    }  
    public static String getShape() {  
        return "Round";  
    }  
}
```

Static members

- All static members (variables, methods, constants) are not coupled with any object.
- Accessing (public) static members is by calling the class name:
 - `ClassName.staticVariable;`
 - `ClassName.staticMethod();`

25

© Boaz Kantor, IDC

Example – what does it do?

```
public class RcSample {
    private static int references = 0;
    public RcSample() {
        RcSample.references++;
    }
    public static int getReferences() {
        return RcSample.references;
    }
}
```

26

© Boaz Kantor, IDC

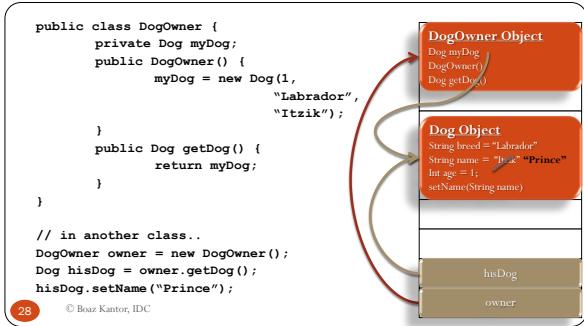

Another example

```
public class DogOwner {
    private Dog myDog;
    public DogOwner() {
        myDog = new Dog(1, "Labrador", "Itzik");
    }
    public Dog getDog() {
        return myDog;
    }
}

// in another class...
DogOwner d = new DogOwner();
Dog hisDog = d.getDog();
hisDog.setName("Prince");
```

27

© Boaz Kantor, IDC

28

`clone()`

- Aliasing out private members with external variables compromises encapsulation.
 - Instead of aliasing we should implement a `clone()` method, which creates a copy of that member.

29

© Boaz Kantor, IDC

Standard methods

```
public class Dog {  
    private int age;  
    private String breed;  
    private String name;  
    public Dog(int age, String breed, String name) {  
        setAge(age);  
        setBreed(breed);  
        setName(name);  
    }  
    public Dog clone() {  
        Dog newDog = new Dog(getAge(), getBreed(), getName());  
        return newDog;  
    }  
    OR:  
    return new Dog(getAge(), getBreed(), getName());  
}
```

30

© Boaz Kantor, IDC

Standard methods

```

public Dog clone() {
    return new Dog(getAge(), getBreed(), getName());
}

public String toString() {
    return "Name: " + getName() + "\nBreed: " + getBreed() + "\nAge: " + getAge();
}

public boolean equals(Dog other) {
    return getAge() == other.getAge()
        && getBreed().equalsIgnoreCase(other.getBreed())
        && getName().equalsIgnoreCase(other.getName());
}

public static Dog parse(String string) {
    int age = Integer.parseInt(string.substring(0)); // find the age in the String
    String breed = string.substring(1); // find the breed in the String
    String name = ... // find the name in the string
    return new Dog(age, breed, name);
}

```

© Boaz Kantor, IDC

String vs. StringBuilder

- String
 - Is immutable = its state never changes:
 - String bla = "abc";
 - bla = bla.replace("ab", "cc");
 - Java does great effort to make it look like you can change the text in a String variable.
 - Since it's immutable, you can't create an alias to it.
- StringBuilder:
 - Is mutable = its state is changed:
 - StringBuilder bla = new StringBuilder("abc");
 - bla.replace("ab", "cc");
 - To avoid Java's great effort we sometimes use StringBuilder instead of String.
 - You can create an alias to StringBuilder.
- Use StringBuilder whenever you need lots of string manipulation, but be extra careful with encapsulation and aliasing!
